General P-splines for Non-Uniform B-splines (R code)

Zheyuan Li (zheyuan.li@bath.edu) and Jiguo Cao (jiguo_cao@sfu.ca)

Follow this document to reproduce all demos, computational results, simulation outcomes and real data analysis in the paper. You need to first install **gps** and **gps.mgcv** either from CRAN or GitHub.

```
## installation from GitHub
## you may need to first install "devtools" from CRAN
devtools::install_github("ZheyuanLi/gps")
devtools::install_github("ZheyuanLi/gps.mgcv")
```

Load required packages and define a utility function that is used throughout this document.

```
library(splines)
library(mgcv)
library(gps)
library(gps.mgcv)

## plot a fitted penalized B-splines against observed (x, y) data and true function g(x)
## gamfit: a fitted GAM model, should only have a single s(x) term of B-splines class
## x, y: observed (x, y) data
## g: the true function g(x)
PlotXYFit <- function (gamfit, x, y, g) {
  ## g must be a function
  if (!is.function(g)) stop("g is not a function!")
  ## plot (x, y) data
  plot(x, y, col = 8, ann = FALSE)
  ## show knot location
  abline(v = gamfit$smooth[[1]]$knots, lty = 2, col = 8)
  ## overlay g(x)
  nx <- length(x)
  xg <- seq(min(x), max(x), length = nx)
  lines(xg, g(xg), col = 2, lwd = 2)
  ## plot estimated f(x) at xg
  yh <- predict(gamfit, newdata = data.frame(x = xg))
  lines(xg, yh, lwd = 2)
```

```
}
```

1 Introduction

Figure 1 is produced in 4.1 BMC Longitudinal Data.

2 The New General P-splines

2.1 Standard P-splines

The following code produces Figure 2.

```
## U-shaped curve
g <- function (x) abs(x) ^ 3 - 0.2 * x ^ 4

## number of data
n <- 500
## noise-to-signal ratio
n2s.ratio <- 0.4
## x-values
x <- qnorm(seq(pnorm(-3), pnorm(3), length = n))
## noisy y-values
gx <- g(x)
set.seed(2021); y <- rnorm(length(gx), gx, n2s.ratio * sd(gx))

## number of interior knots
k <- 50

## fit 4 types of penalized B-splines
fit <- gps.mgcv::Fit4BS(x, y, k, select = c("sps", "nps"))

pdf("fig2.pdf", width = 7.5, height = 2.5)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))
## uniform B-splines
PlotXYFit(fit$sps, x, y, g)
title("uniform B-splines")
## non-uniform B-splines
PlotXYFit(fit$nps, x, y, g)
title("non-uniform B-splines")
## boxplot of MSE
mse <- gps.mgcv::MSE4BS(x, g, k, n2s.ratio = n2s.ratio, select = c("sps", "nps"))
colnames(mse) <- c("uniform", "non-uniform")
boxplot(mse, main = "MSE (100 simulations)")
dev.off()
```

The following code produces Figure 3.

```
pdf("fig3.pdf", width = 6, height = 4)
gps::DemoNull(n = 100, k = 10, gps = FALSE)
dev.off()
```

2.2 Introducing General P-splines

The following code computes general difference matrices of order 1 to 3 on the example knot sequence.

```
## general difference matrices of order 1 to 3
D <- gps::SparseD(xt = c(0, 0, 0, 0, 1, 3, 4, 4, 4, 4), d = 4)
## 1st order
D[[1]]
## 2nd order
D[[2]]
## 3rd order
D[[3]]
```

2.4 Connection with O-splines

The following code computes matrix “S.bar” of order 1 to 3 on the example knot sequence.

```
gps::SandBar(xt = c(0, 0, 0, 0, 1, 3, 4, 4, 4, 4), d = 4, m = 1)
gps::SandBar(xt = c(0, 0, 0, 0, 1, 3, 4, 4, 4, 4), d = 4, m = 2)
gps::SandBar(xt = c(0, 0, 0, 0, 1, 3, 4, 4, 4, 4), d = 4, m = 3)
```

3 Simulation Studies

U-Shaped Curve Example The following code produces Figure 4.

```
## n, number of data
## n2s.ratio, noise-to-signal ratio
## k, number of interior knots
UCurve <- function (n = 500, n2s.ratio = 0.4, k = 50) {
  ## g(x)
  g <- function (x) abs(x) ^ 3 - 0.2 * x ^ 4
  ## x-values
  x <- qnorm(seq(pnorm(-3), pnorm(3), length = n))
  ## noisy y-values
  gx <- g(x)
  y <- rnorm(length(gx), gx, n2s.ratio * sd(gx))
  ## fit O-splines and standard/general P-splines
  fit <- gps.mgcv::Fit4BS(x, y, k, select = c("os", "sps", "gps"))
  ## general P-splines
  PlotXYFit(fit$gps, x, y, g)
  title("general P-splines")
  ## boxplot of MSE
```

```
  mse <- gps.mgcv::MSE4BS(x, g, k, n2s.ratio = n2s.ratio, select = c("os", "sps", "gps"))
  boxplot(mse, main = "MSE (100 simulations)")
}

set.seed(2021)
pdf("fig4.pdf", width = 8, height = 4)
par(mfrow = c(1, 2), mar = c(2, 2, 1.5, 0.5))
UCurve(n = 500, n2s.ratio = 0.4, k = 50)
dev.off()
```

Random Curve Example The following code produces Figure 5.

```
pdf("fig5.pdf", width = 9, height = 3)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))

## number of data
n <- 500
## number of interior knots
k <- 40
## noise-to-signal-ratio
n2s.ratio <- 0.4

## simulate a random spline
set.seed(2021)
spl <- gps.mgcv::RandomSpl(n)
title("a random spline function")
## g(x)
g <- splinefun(spl$xg, spl$yg, method = "natural")

## x-values
x <- spl$x
## noisy y-values
gx <- spl$y
y <- rnorm(length(gx), gx, n2s.ratio * sd(gx))

## fit O-splines and standard/general P-splines
fit <- gps.mgcv::Fit4BS(x, y, k, select = c("os", "sps", "gps"))

## standard P-splines
PlotXYFit(fit$sps, x, y, g)
title("standard P-splines")
## general P-splines
PlotXYFit(fit$gps, x, y, g)
title("general P-splines")
dev.off()
```

The following code produces Figure 6.

```
## fit O-splines and standard/general P-splines, with different penalty order
fit1 <- gps.mgcv::Fit4BS(x, y, k, m = 1, select = c("os", "sps", "gps"))
```

```
fit2 <- gps.mgcv::Fit4BS(x, y, k, m = 2, select = c("os", "sps", "gps"))
fit3 <- gps.mgcv::Fit4BS(x, y, k, m = 3, select = c("os", "sps", "gps"))
## predict fitted spline
yp1 <- sapply(fit1[c("os", "sps", "gps")], predict, newdata = data.frame(x = spl$xg))
yp2 <- sapply(fit2[c("os", "sps", "gps")], predict, newdata = data.frame(x = spl$xg))
yp3 <- sapply(fit2[c("os", "sps", "gps")], predict, newdata = data.frame(x = spl$xg))
## subtract g(x) from fitted values
dp1 <- yp1 - spl$yg
dp2 <- yp2 - spl$yg
dp3 <- yp3 - spl$yg
ylim1 <- range(dp1, dp2, dp3)
## assess MSE performance in 100 simulations
mse1 <- gps.mgcv::MSE4BS(x, g, k, m = 1, n2s.ratio = n2s.ratio, select = c("os", "sps",
        "gps"))
mse2 <- gps.mgcv::MSE4BS(x, g, k, m = 2, n2s.ratio = n2s.ratio, select = c("os", "sps",
        "gps"))
mse3 <- gps.mgcv::MSE4BS(x, g, k, m = 3, n2s.ratio = n2s.ratio, select = c("os", "sps",
        "gps"))
ylim2 <- range(mse1, mse2, mse3)

pdf("fig6.pdf", width = 9, height = 6)
par(mfrow = c(2, 3), mar = c(2, 2, 1.5, 0.5))
matplot(spl$xg, cbind(dp1[, "os"], dp2[, "os"], dp3[, "os"]),
        type = "l", ylim = ylim1, lwd = 2, lty = 1:3, ann = FALSE)
legend("topleft", legend = paste0("m = ", 1:3), col = 1:3, lwd = 2, lty = 1:3,
       cex = 1.25, bty = "n", text.col = 1:3)
title("O-splines")
matplot(spl$xg, cbind(dp1[, "sps"], dp2[, "sps"], dp3[, "sps"]),
        type = "l", ylim = ylim1, lwd = 2, lty = 1:3, ann = FALSE)
legend("topleft", legend = paste0("m = ", 1:3), col = 1:3, lwd = 2, lty = 1:3,
       cex = 1.25, bty = "n", text.col = 1:3)
title("standard P-splines")
matplot(spl$xg, cbind(dp1[, "gps"], dp2[, "gps"], dp3[, "gps"]),
        type = "l", ylim = ylim1, lwd = 2, lty = 1:3, ann = FALSE)
legend("topleft", legend = paste0("m = ", 1:3), col = 1:3, lwd = 2, lty = 1:3,
       cex = 1.25, bty = "n", text.col = 1:3)
title("general P-splines")
boxplot(mse1, main = "MSE (m = 1)", ylim = ylim2)
boxplot(mse2, main = "MSE (m = 2)", ylim = ylim2)
boxplot(mse3, main = "MSE (m = 3)", ylim = ylim2)
dev.off()
```

Random Curve Example (continued) The following code produces Figure 7. Simulations takes some time, so I did them using `nc = 4` CPU cores.

```
## simulations with random cubic splines
cubic_1000_0.1 <- gps.mgcv::SimStudy(n = 1000, degree = 3, n2s.ratio = 0.1, nc = 4)
cubic_1000_0.5 <- gps.mgcv::SimStudy(n = 1000, degree = 3, n2s.ratio = 0.5, nc = 4)
cubic_5000_0.1 <- gps.mgcv::SimStudy(n = 5000, degree = 3, n2s.ratio = 0.1, nc = 4)
cubic_5000_0.5 <- gps.mgcv::SimStudy(n = 5000, degree = 3, n2s.ratio = 0.5, nc = 4)

## plot grouped boxplot
```

```
PlotMSE <- function (mse, n, gamma) {
  N <- ncol(mse) / 3
  at <- matrix(seq_len(4 * N), 4, N)[1:3, ]
  lab <- rep_len(c("os", "sps", "gps"), 3 * N)
  m <- sprintf("m = %d", 1:N)
  boxplot(mse, at = at, names = lab, xlim = extendrange(at, f = 0.01))
  mtext(m, side = 1, at = colMeans(at), line = 2.5)
  legend("top", legend = sprintf("n = %d, gamma = %.1f", n, gamma), bty = "n", cex = 1.5)
}

pdf("fig7.pdf", width = 9, height = 6)
par(mfrow = c(2, 2), mar = c(3.5, 2.5, 0.5, 0.5))
PlotMSE(cubic_1000_0.1, 1000, 0.1)
PlotMSE(cubic_1000_0.5, 1000, 0.5)
PlotMSE(cubic_5000_0.1, 5000, 0.1)
PlotMSE(cubic_5000_0.5, 5000, 0.5)
dev.off()
```

Inhomogeneously Smooth Curve Example The following code produces Figure 8.

```
## n, number of data
## n2s.ratio, noise-to-signal ratio
## k, number of interior knots
AdaptiveCurve <- function (n = 500, n2s.ratio = 0.25, k = 50) {
  ## g(x)
  g <- function (x) x + sin(10 * pi * x ^ 5)
  ## x-values
  x1 <- seq.int(0, 1, length.out = k)[2:49]
  x2 <- seq.int(0, 1, length.out = n - length(x1)) ^ (1 / 5)
  x <- sort(c(x1, x2))
  ## noisy y-values
  gx <- g(x)
  y <- rnorm(length(gx), gx, n2s.ratio * sd(gx))
  ## fit O-splines and standard/general P-splines
  fit <- gps.mgcv::Fit4BS(x, y, k, select = c("os", "sps", "gps"))
  ## standard P-splines
  PlotXYFit(fit$sps, x, y, g)
  title("standard P-splines")
  ## general P-splines
  PlotXYFit(fit$gps, x, y, g)
  title("general P-splines")
  ## boxplot of MSE
  mse <- gps.mgcv::MSE4BS(x, g, k, n2s.ratio = n2s.ratio, select = c("os", "sps", "gps"))
  boxplot(mse, main = "MSE (100 simulations)")
}

set.seed(2021)
pdf("fig8.pdf", width = 9, height = 3)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))
AdaptiveCurve(n = 1000, n2s.ratio = 0.25, k = 50)
dev.off()
```

4 Real Data Examples

4.1 BMC Longitudinal Data

The paper only takes male group for demonstration.

```
BMC <- gps.mgcv::synBMC(gender = "male")
head(BMC)

## number of subjects
N <- nlevels(BMC$id)
## split this data set by subject
BMC.id <- split(BMC[-1], BMC$id)
```

The following code produces Figure 9.

```
pdf("fig9.pdf", width = 7.5, height = 2.5)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))
## (A) BMC data (bmc ~ age)
with(BMC, plot(age, bmc, type = "n", ann = FALSE))
for (i in 1:N) with(BMC.id[[i]], lines(age, bmc, col = i))
title("(A) bmc ~ age")
## (B) BMC data (log(bmc) ~ age)
with(BMC, plot(age, log.bmc, type = "n", ann = FALSE))
for (i in 1:N) with(BMC.id[[i]], lines(age, log.bmc, col = i))
title("(B) log(bmc) ~ age")
## (C) distribution of age
hist(BMC$age, breaks = 15, ann = FALSE)
title("(C) distribution of age")
dev.off()
```

gps.mgcv provides a function `FitBMC` for fitting standard/general P-splines to BMC data. You may read its source code to see how an additive mixed model is specified using factor smooth ("fs") and estimated via `mgcv::gamm`.

```
## fit BMC using 10 and 20 B-splines
system.time(gps.10 <- gps.mgcv::FitBMC(gender = "male", p = 10, gps = TRUE)$gam)
system.time(sps.10 <- gps.mgcv::FitBMC(gender = "male", p = 10, gps = FALSE)$gam)
system.time(gps.20 <- gps.mgcv::FitBMC(gender = "male", p = 20, gps = TRUE)$gam)
system.time(sps.20 <- gps.mgcv::FitBMC(gender = "male", p = 20, gps = FALSE)$gam)
```

(On my laptop, fitting models with `p = 10` and `p = 20` takes 14 and 90 seconds, respectively. Using `p = 30` takes even longer time: 290 seconds.)

Predict population and subject trajectories.

```
## a grid of age values to make prediction
age <- seq(min(BMC$age), max(BMC$age), length = 100)
## newdata
newdat1 <- data.frame(age = rep.int(age, N),
                      id = rep(levels(BMC$id), each = length(age)))
newdat2 <- data.frame(age = age, id = "M001")

## predict all subject BMC trajectories
sub.gps.10 <- matrix(exp(predict(gps.10, newdat1)), nrow = length(age))
sub.sps.10 <- matrix(exp(predict(sps.10, newdat1)), nrow = length(age))
sub.gps.20 <- matrix(exp(predict(gps.20, newdat1)), nrow = length(age))
sub.sps.20 <- matrix(exp(predict(sps.20, newdat1)), nrow = length(age))

## predict population BMC trajectory
pop.gps.10 <- predict(gps.10, newdat2, type = "terms", terms = "s(age)")
pop.sps.10 <- predict(sps.10, newdat2, type = "terms", terms = "s(age)")
pop.gps.20 <- predict(gps.20, newdat2, type = "terms", terms = "s(age)")
pop.sps.20 <- predict(sps.20, newdat2, type = "terms", terms = "s(age)")
pop.gps.10 <- exp(as.numeric(pop.gps.10) + attr(pop.gps.10, "constant"))
pop.sps.10 <- exp(as.numeric(pop.sps.10) + attr(pop.sps.10, "constant"))
pop.gps.20 <- exp(as.numeric(pop.gps.20) + attr(pop.gps.20, "constant"))
```

```
pop.sps.20 <- exp(as.numeric(pop.sps.20) + attr(pop.sps.20, "constant"))

## extract knots
knots.gps.10 <- gps.10$smooth[[1]]$knots
knots.sps.10 <- sps.10$smooth[[1]]$knots
knots.gps.20 <- gps.20$smooth[[1]]$knots
knots.sps.20 <- sps.20$smooth[[1]]$knots
```

The following code produces Figure 10.

```
PlotID <- function (id1, id2, pop.gps, pop.sps, sub.gps, sub.sps,
                    knots.gps, knots.sps, ylim) {
  dat1 <- BMC.id[[id1]]
  gps1 <- sub.gps[, id1]
  sps1 <- sub.sps[, id1]

dev.off()
```

4.2 Fossil Shell Data

Consider the `smooth.spline` fit to the data as "truth".

```
## you may need to first install "SemiPar" from CRAN
data(fossil, package = "SemiPar")

## treat fossil data as (x, y) data
x <- fossil$age
y <- fossil$strontium.ratio
ind <- order(x)
x <- x[ind]
y <- y[ind]

## consider a cubic smoothing spline fit as g(x)
sm <- smooth.spline(x, y)
g <- function (x) predict(sm, x = x)$y
```

The following code produces Figure 12.

```
## fit 4 types of penalized B-splines with 20 interior knots
fit20 <- gps.mgcv::Fit4BS(x, y, k = 20, select = c("gps", "sps"))

## use the same knots as placed by smooth.spline()
nk <- length(sm$fit$knot) - 8
fit62 <- gps.mgcv::Fit4BS(x, y, k = nk, select = c("gps", "sps"))

pdf("fig12.pdf", width = 9, height = 3)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))
PlotXYFit(fit20$gps, x, y, g)
title("gps (20 interior knots)")
PlotXYFit(fit20$sps, x, y, g)
title("sps (20 interior knots)")
PlotXYFit(fit62$gps, x, y, g)
title("gps (62 interior knots)")
dev.off()

## residual sum of squares
sum(fit62$sps$residuals ^ 2)
sum(fit62$gps$residuals ^ 2)
```

```
sum((y - sm$y) ^ 2)
```

The following code produces Figure 13.

```
## extract leave-one-out GCV score for various k
k <- seq(10, 60, by = 2)
pse <- matrix(0, length(k), 2)
for (i in 1:length(k)) {
  fit.i <- gps.mgcv::Fit4BS(x, y, k[i], select = c("gps", "sps"))
  pse[i, ] <- unlist(lapply(fit.i, "[[", "gcv.ubre.dev"))
}

pdf("fig13.pdf", width = 6, height = 4)
par(mar = c(3, 3, 0.5, 0.5))
matplot(k, pse, type = "l", lty = c(2, 1), lwd = 2, col = 1, ann = FALSE)
mtext("number of interior knots (k)", side = 1, line = 2)
mtext("CV score", side = 2, line = 2)
dev.off()
```

The following code produces Figure 14.

```
## a zoom-in on [92, 106]
ind <- (x < 106)
xx <- x[ind]
yy <- y[ind]

pdf("fig14.pdf", width = 8, height = 3)
par(mfrow = c(1, 3), mar = c(2, 2, 1.5, 0.5))
k <- c(10, 13, 16)
for (i in 1:3) {
  fit.i <- gps.mgcv::Fit4BS(x, y, k[i], select = "gps")
  PlotXYFit(fit.i$gps, xx, yy, g)
  title(sprintf("k = %d", k[i]), cex.main = 2)
}
dev.off()
```

Appendix: Spline and B-splines

The following code produces Figure 15.

```
pdf("fig15.pdf", width = 6, height = 4)
out <- gps::DemoSpl(uniform = TRUE)
dev.off()
```

The following code computes coefficients for clamped B-splines.

```
## 8 equidistant points on the domain (because there are 8 B-splines)
x <- seq(1, 6, length = 8)
```

```r
## full knot sequence for uniform B-splines
xt1 <- -2:9
## full knot sequence for clamped B-splines
xt2 <- c(1, 1, 1, 1:6, 6, 6, 6)
## evaluate the spline using uniform B-splines
B1 <- splines::splineDesign(xt1, x)
y <- B1 %*% out$bspl.coef
## back solve coefficients of clamped B-splines
B2 <- splines::splineDesign(xt2, x)
solve(B2, y)
```
